

RAG Assignment

In the retriever.py, change the prompt to:

"Recommend a HR talent specialist"

You will notice the name is not returned.

This is due to the “similar chunks” being returned from the Vector DB not containing the name (As name is only mentioned on top of the resume so it is there only in the top chunks)

Your task is to fix the above issue so it recommends the name of the matching person as well.

Hints:

- 1) In indexer.py, when adding the chunk to the vector db, you will need to add the metadata as well, something like below:

```
{"name": "Pankaj",  
  "emp_id": "122",  
  "linkedin_url" : "https://linkedin.com/in/agrawalvijay"  
}
```

- 2) Clear/delete the embeddings in the vector db before re-creating the embeddings
- 3) You will need to pass the matching chunks+metadata to the llm
